Male Hartly strain guinea pigs were sacrificed by decapitation. The trachea and lung were removed and homogenized in buffer (0.25 M sucrose, 50 mM Tris-HCl pH 7.5, 0.1 mM EDTA) by using Polytron (Kinematica). The homogenate was centrifuged (1000 xg, 10 min) to remove tissue clumps and the
 10 supernatant was centrifuged (14000 xg 20 min) to yield pellets. The pellets were resuspended in buffer (5 mM Tris-HCl pH 7.5), homogenized with a teflon homogenizer and centrifuged (14000 xg, 20 min) to yield pellets which were referred to as crude membrane fractions. The obtained pellets were stored at -70 °C until use.

15 (b) ^3H -Substance P binding to preparation membrane

At the end of the incubation period, reaction mixture was quickly filtered over a Whatman GF/B glass filter (pretreated with 0.1% polyethylene imine for 3 hours prior to use) under aspiration. The filters were then washed four times with 5 ml of the buffer (50 mM Tris-HCl, pH 7.5). Preparation 1

A solution of Starting Compound (5.48 g) and NMM (2.09 g) in methylene chloride (50 ml) was cooled at -20°C . To this solution was added dropwise isobutyl chloroformate (2.82 g) maintaining the temperature between -22°C to -20°C in 7 minutes. After stirring the mixture for 20 minutes at the same temperature, the solution was cooled to -35°C and HNMeBzl (2.50 g) was added dropwise to the solution. The reaction mixture was stirred for 2 hours during which period the temperature was gradually raised to -2°C . The solution was washed successively with water (twice), diluted sodium hydrogencarbonate solution (twice), water, 0.5N hydrochloric acid (twice) and sodium chloride solution, and dried over magnesium sulfate. After evaporation, the solidified residue was pulverized in hot IPE (10 ml), and after cooling, n-hexane (30 ml) was added to the mixture. The crystalline solid was filtered, washed with n-hexane (5 ml x 2), and dried to give Object Compound (6.49 g).

To a solution of Boc-Asp(OBzl)-OH (3.23 g) and NMM (1.01 g) in methylene chloride (30 ml) was added isobutyl chloroformate (1.37 g) dropwise at -20 °C. The solution was stirred at the same temperature for twenty minutes. The solution was cooled to -35 °C and was added to a solution of Starting Compound (3.05 g) and NMM (1.01 g) in methylene chloride (20 ml). The mixture was stirred for an hour, raising the
15 temperature gradually to 0 °C, and further stirred under ice cooling for half an hour. After concentration, the product was extracted with ethyl acetate and the organic layer was washed with water, diluted sodium hydrogencarbonate solution, 0.5N hydrochloric acid, and sodium chloride solution, and dried over magnesium sulfate. After concentration and crystallization with a mixed solvent of diethyl ether and IPE under ice-cooling gave Object Compound (3.97 g).

25 Preparation 17

To a solution of Boc-Asp(OBzl)-OH (0.97 g), Starting Compound (0.914 g) and HOBT (0.405 g) in a mixed solvent of methylene chloride (25 ml) and DMF (5 ml) was added WSC (0.511 g) under ice-cooling. The solution was stirred at the same temperature for three hours. After concentration the product was
30 extracted with ethyl acetate. The organic layer was washed successively with water, diluted sodium hydrogencarbonate solution, 0.5N hydrochloric acid, sodium chloride solution, and dried over magnesium sulfate. Concentration gave a crude product (1.72 g), which was purified on a silica gel column eluting with chloroform-ethyl acetate (4:1) to give Object Compound (1.68 g).

35 Preparation 18

A mixture of Starting Compound (1.0 g) and anisole (1.0 ml) was treated with TFA (15 ml) under ice-cooling for fifteen minutes and further at room temperature for twenty minutes. After concentration of the mixture, 4N-HCl/DOX (0.85 ml) was added and concentrated again. The residue was washed with n-hexane
40 and IPE four times respectively and the powder was filtered, washed with IPE and dried under vacuum to give Object Compound (0.87 g). The product was used in the next reaction without purification.

Preparation 19

45 To an ice-cooled solution of Starting Compound (2.81 g), HOBT (1.35 g) and N-(2-pyridylmethyl)-N-methylamine (1.22 g) in methylene chloride (28 ml) was added WSC·HCl (1.92 g). The solution was stirred at room temperature for four hours and washed successively with 5% sodium hydrogencarbonate solution, sodium chloride solution and was dried over magnesium sulfate. Evaporation and purification on a silica gel column (84 g) eluting with chloroform-methanol (20:1) gave Object Compound (3.14 g) as an oil.

55 Preparation 20

To an ice-cooled solution of Starting Compound (3.9 g) and anisole (3.9 ml) in methylene chloride (40 ml) was added TFA (25 ml). The solution was stirred for half an hour at room temperature. After

evaporation, addition and re-evaporation of 4N-HCl/DOX (5 ml) were repeated twice. The residue was extracted with ethyl acetate and the organic layer was washed successively with saturated sodium hydrogencarbonate solution and brine, and dried over anhydrous magnesium sulfate to give the above Intermediate (3.03 g). To the solution in DMF (50 ml) containing Intermediate obtained was added Boc-Pro-OH (2.15 g), HOBT (1.35 g) and WSC·HCl (1.92 g). The solution was stirred for one and half an hour at room temperature. After evaporation and extraction with ethyl acetate. The organic layer was washed successively with water, 1N hydrochloric acid, water, 5% sodium hydrogencarbonate, water and saturated sodium chloride and dried over magnesium sulfate. The evaporated residue was subjected to column chromatography on silica gel (120 g) and eluted with a mixture of ethyl acetate and toluene (1:3). The fractions containing the object compound were combined and evaporated. The residue was collected by filtration, and dried to give Object Compound (4.34 g).

Preparation 34

40 To an ice-cooled solution of Starting Compound (2.31 g) and methyl iodide (5 ml) in THF (30 ml) was added sodium hydride (60% in oil, 1.2 g) under atmosphere of nitrogen. The mixture was stirred for one and half an hour at the same temperature and for nine hours at room temperature. Ether and water were added to the reaction mixture and the aqueous layer was separated. After acidification with 6N hydrochloric acid, the aqueous layer was extracted with ethyl acetate twice. The extract was washed successively with water and sodium chloride solution and was dried over magnesium sulfate. Evaporation of the extract gave

50 Starting Compound (865 mg) was treated in TFA (15 ml) under ice-cooling for ten minutes and at room temperature for ten minutes. After concentration, the residue was dissolved in methylene chloride (30 ml), and under cooling, a solution of sodium hydrogencarbonate was added until aqueous layer was neutralized to pH 7. The organic layer was separated, washed with sodium chloride solution and dried over anhydrous magnesium sulfate to give the intermediate. After filtration, BSA (0.905 g) was added to the filtrate, and under ice-cooling, indole-3-carbonyl chloride (384 mg) was added. The solution was stirred for half an hour and concentrated. The residue was dissolved in a mixture of THF (15 ml) and 1N hydrochloric acid (5 ml),

and the solution was stirred for half an hour. Ethyl acetate and water were added to the solution and the separated organic layer was washed with water, diluted sodium hydrogencarbonate solution, and sodium chloride solution, and dried over magnesium sulfate. After concentration, the residue was dissolved in chloroform and subjected to a silica gel column chromatography and eluted first with ethyl acetate and then with chloroform-methanol (4:1). The main fraction was concentrated and the residue was triturated with ether, filtered, and dried to give Object Compound (683 mg).
